- Priority: Stimuli
    - Check in about the filler stereo recordings I made earlier this week (~240!!!)
    - Talk about my plans to use the stimuli "sets" for the list designs
    - How to create the catch trials; beep sound and systematic implementation

- Talking timeline
    - Potential goals:
        - Finish putting together all the recordings
        - Begin looking into the Prolific code and creating the CSV file(s)
        - Writing up instructions!!!
        - Try to launch the experiment late August or September?
            - How reasonable is this goal?
    - Written sections to start on:
        - I think it might be a good idea to begin drafting a methodology
            - write about what I am doing and the decisions I am making in real time? → very early draft, more notes-like
        - Time permitting, I'd like to start piecing together an intro in these few weeks before classes begin, maybe?
    - *** For the writing goals: what would be the best way to work on these in terms of seeking feedback/check-ins?**
        -

- For next week
    - Finish up stims
    - Make CSV file(s)
    - See what's needed for code → I'd like to familiarize myself with how other studies were coded, if possible?
        - My main goal is to better understand how it works on a general level
